

Early Warning Indicator Systems

A Continuous Learning Model

As this model shows, early warning indicators (ERI) systems are invaluable tools for creating a more adaptive, learning organization. Each ERI system is an end product of a foresight process like scenario planning, and thus are specific to the strategic risks and opportunities of the organization. We can also connect these indicators to existing systems (e.g. financial, competitive intelligence, enterprise resource planning) to help embed a more dynamic, future-oriented view in the organization.
